

## eBizServ Hosting

After managing numerous hosting services for our customers, we have learned that for many of them it is just easier not to have to manage the details of their own hosting account. Based on this experience we are now offering hosting to our customers. Hosting is not limited to your web site, however. Taking advantage of hosting services, a small business can enjoy many of the IT services a larger business typically supports in-house. You are welcome to consider your eBizServ hosted environment for more than your web site.

Beyond their web sites, many businesses are running key applications from hosted environments. The most common is email services using the same domain name as your site. The advantage we offer for email is Postinini Spam filtering. This very effective service is included with your hosting account and does not run on your server using up resources.

As comfort levels grow with the reliability of hosted services, companies are moving packages such as workgroup collaboration software and CRM (Customer Relationship Management) packages to hosting sites. Budget permitting, they are also opting to purchase these services, which are hosted applications, from vendors like Salesforce.com

Hosting services offer a high level of system reliability and offer 24/7 operations. They provide complete IT services (backup, ups, multiple internet connections, etc.) associated with supporting these applications and reduce the cost by spreading it accross multiple clients.

Hosting can begin with a simple web server runing on a virtual server for a low monthly fee. These services can also be scaled to meet your requirements as they grow. The high end may involve one or more dedicated servers. Regardless of the scale, in most cases hosting service remain more cost effective than bringing the infrastructure (and staff) in-house to support your critical applications and IT services.

Please contact us if you would like to learn more about leveraging our hosting services to your advantage
